Supplement Fig. 3. **p100SSS/AAA remains normal in Tax binding.** Tax was transfected into 293 cells together with either an empty vector, wildtype p100, or p100SSS/AAA. The p100 proteins were isolated from the cell lysates by IP using anti-p100. The precipitated p100 proteins and the associated Tax were detected by immunoblotting (IB) using anti-p100 and anti-Tax, respectively (top two panels). The expression of Tax in the lysates were analyzed by immunoblotting using anti-Tax (bottom panel).
