Supplemental Figure 2  Rab11 is not required for FIP3:Exo70p interactions

HeLa cells were transfected with mock or siRNA specific for Rab11 (Wilson et al., 2005). After 48h, cells were lysed and the lysates probed for Rab11, FIP3 or Exo70 (left panels). Anti-Exo70p or random IgG was used in an immunoprecipitation from these lysates, and the IP’s probed for FIP3 or Exo70 (right panels). Data from a representative experiment is shown.
