Supplementary Figure S1 The normally essential RNA editing ligase 1 (KREL1) is not required in the Dk trypanosome *T. evansi* Antat 3/3. (A) Western blot analysis of *T. evansi* KREL1<sup>+/-</sup> and KREL1<sup>-/-</sup> cells. Cell lysates were fractionated by SDS-PAGE, transferred to PVDF membrane, and probed with monoclonal antibodies against four components of the mitochondrial RNA editing complex. (B) Growth comparison. Cells were maintained in the exponential growth phase and cumulative cell numbers reflect normalization for dilution during cultivation.
