Supplementary information

Figure 2

A.

(A) Disruption of the ARs in HEXIM1 does not influence its oligomerization properties. h6.x.Hex1 and f.Hex1 proteins were expressed in HeLa cells from corresponding plasmid effectors (6 g; lanes 1 to 4) alone or in combination as indicated above the western blot. The proteins were subjected to immunoprecipitation by the anti FLAG M2 beads as presented. Arrows to the left indicate the bound h6.x.Hex1 proteins (IP) and 10 % inputs (i) of the proteins used in the assay.
