Figure S2. Distribution of lipid rafts in HSCs and progenitor cells
Freshly isolated CD34−KSL HSCs and CD34+KSL progenitor cells were incubated for 30 min in the presence or absence of cytokines (20 ng/ml SCF and 50 ng/ml TPO), and were stained with DAPI (blue) and CTB (green) as described in Figs. 1 and 2 legends. Cells were analyzed under an inverted fluorescence microscopy.
