Supplementary Figure 4 Agonist-dependent dissociation of β₁AR/PDE4D complexes does not require β-arrestin. Exogenous β₁AR and PDE4D8-Myc were co-immunoprecipitated from extracts of mouse embryonic fibroblasts derived from mice deficient in β-arrestin 1 and 2 (βarr1/2KO-MEFs) that had been pre-treated for 5 min with or without 100 µM Norepinephrine (NE). A representative experiment is reported.
