Supplemental Figure S5  (A) HAECs were transfected with siRNAs for FHOD1. After cultured for 72 h, cells were stimulated with 100 nM thrombin for 1 h. Fixed cells were visualized by GFP fluorescence or phalloidin staining. The percentages of cells showing stress fiber formation throughout the cell were calculated and the data from three independent transfections are expressed as the mean + s.d.  (B) HPAECs were transfected with siRNAs for FHOD1 and cultured for 72 h. Cells were stimulated with 100 µM histamine for 1 h, and fixed, followed by visualization by GFP fluorescence or phalloidin staining. The percentages of cells showing stress fiber formation throughout the cell were calculated.
