C

Supplemental Figure 2: Graphs showing the effect of various concentrations of α-amanitin and actinomycin D on cell proliferation over time. The graphs demonstrate the period length [h] for different treatments:

- **A**: α-amanitin at concentrations of 0, 1, 3, and 5 µg/ml, with period lengths of 25.7, 24.2, 23.2, and 26.1 h, respectively.
- **B**: Actinomycin D at 20 nM, 50 nM, and 100 nM, with period lengths of 25.5, 25.2, and 21.9 h, respectively.
- **C**: α-amanitin at 0, 1, 3, and 5 µg/ml, with period lengths of 24.4, 23.2, and 26, respectively.

The graphs illustrate the cpm (counts per minute) over time, with the x-axis representing hours and the y-axis representing cpm or counts per second.
