Supplementary Figure 5

(A) Enrichment levels of IgG controls (shown as percent of input) relative to the ChIP analysis presented in Figure 6C.

(B) Recruitment of BRCA1 and PALB2 also occurs at NF-κB responsive genes that are not affected by BRCA1 or PALB2 depletion in MCF7 cells (i.e. IRF, BCL3 and MAP3K8 are responsive to TNFα and dependent on p65 but not BRCA1 and PALB2 for their activation, cf. Supplementary Table S4).
